

Abstract

Conference: Fourth International Academy of Astronautics International
Conference on Low-Cost Planetary Missions

Date: May 2 –5, 2000

Location: John Hopkins University/APL, Laurel, Maryland USA

Paper Title: The NASA Discovery 5, Genesis Mission (an Invited Paper)

Presenter: Chester “Chet” Sasaki, JPL, Genesis Project Manager

“*Genesis*” is the NASA Discovery 5 mission to return solar wind samples to the Earth for analyses in terrestrial laboratories. This data will significantly increase our knowledge of the elemental abundance and isotopic composition of the solar system. This knowledge will be used to address questions about the materials and processes involved in the origins of the solar system. While oxygen, nitrogen and noble gas isotopes and elements comprise the primary objectives, Genesis has a total of 19 prioritized measurement objectives.

In order to gather the materials to accomplish its objectives, the mission will place a spinning spacecraft outside the earth’s magnetosphere, in an orbit about the first Earth-Sun libration point (L1), for two years, to collect solar wind samples by implantation into passive collectors made of ultra-pure materials. Two solar wind monitors will be used to determine solar wind regime and speed to control the collection by a set of collector arrays and an electrostatic concentrator. The collected samples are returned to earth and recovered at a U.S. test range.

The integration and test of the flight system and the payload will continue through September 2000, with launch scheduled for January 2001. The sample will be returned to earth approximately 32 months after launch in August 2003.
